

Selected for your multi-signal strategy framework. Includes a new **trend_direction** category with Ehlers Instantaneous Trendline (EIT) and other directional trend followers.

1. Momentum (directional: long / short)

Indicator	Type	Suggested role
RSI (14)	continuous / discrete	Overbought/oversold levels + cross-of-level
Stochastic (14,3,3)	continuous / discrete	%K / %D crossovers + level thresholds
Ehlers Fisher Transform (10)	continuous / discrete	Zero-line cross + overbought/oversold (± 2)
Ehlers Cyber Cycle (20)	continuous	Zero-line cross, cycle phase
MACD (12,26,9)	discrete	Signal line crossover (used as momentum)

2. Trend Strength (regime only, direction = both)

Indicator	Type	Role as filter
ADX (14)	continuous	High strength (>25) vs low strength (<20)
Aroon (25)	continuous	Strong trend (>70) vs weak (<30)
Ehlers Market Mode Identifier	discrete	1 = trending, 0 = cycling – perfect regime filter

Indicator	Type	Role as filter
Choppiness Index (14)	continuous	Low (<38) = trending, high (>62) = choppy
ATR ratio (ATR / Close)	continuous	High ratio (>0.02) signals strong movement (non-directional)

3. Volatility (regime only, direction = both)

Indicator	Type	Role
Garman-Klass (20)	continuous	High/low regime (dynamic threshold)
Donchian Width (20)	continuous	High/low width regime
Bollinger Band Width (20,2)	continuous	Squeeze (low width) vs expansion (high width)
Ehlers Roofing Filter (10,48)	continuous	High-frequency noise; high values = volatile
Yang-Zhang Volatility (20)	continuous	Robust to opening jumps

4. Divergence (discrete, directional long/short)

Indicator	Type	Description
RSI Divergence	discrete	Conventional hidden / regular divergence
Ehlers Reflex	discrete	Built-in divergence detection (price – Reflex cross)
Ehlers Fisher Transform Divergence	discrete	Zero-lag divergence (more sensitive)
MACD Divergence	discrete	Histogram / line divergence
OBV Divergence	discrete	On-Balance Volume divergence

5. Trend Direction (directional: long / short) – NEW CATEGORY

Indicator	Type	Suggested role
Ehlers Instantaneous Trendline (EIT)	continuous	Slope > 0 → long, slope < 0 → short (zero-lag)
SuperTrend (10,3)	continuous	Price above band → long, below band → short
Linear Regression Slope (20)	continuous	Slope > 0 → long, slope < 0 → short
Donchian Channel Breakout (20)	discrete	Price > upper band → long, < lower band → short
MACD Signal Line Crossover	discrete	MACD line crosses above signal → long, below → short

 Integration note:

- **Momentum, Divergence, Trend Direction** – produce directional signals (direction="long" or "short"). Use them for entry/exit.
- **Trend Strength, Volatility** – produce regime signals (direction="both", output 0/1). Use them as filters.
- EIT fits perfectly into the new trend_direction category. Your existing @signal(direction="long") and @signal(direction="short") decorators work unchanged.

 Top 5 selections based on robustness, zero-lag properties, and complementarity.
